1,8,15	Nab-paclitaxel	100 mg/m ² BSA	none	i.v.	30 min	Sequence

Concomitant therapy supplements

For highly emetogenic chemotherapy, additional olanzapine is recommended in the acute (day 1) and delayed phases (days 2-4) at a dosing of 5-10 mg per day (NCCN, ESMO, ASCO, Onkopedia; as of 6/24).

Granisetron instead of Dexamethasone for antiemesis on days 8 and 15 to avoid immunosuppression and the risk of infection due to Dexamethasone exposure.

Notes

4 or 6 induction cycles were administered, after which patients received atezolizumab as maintenance therapy. Therapy is continued until reduction of clinical benefit or the occurrence of undesirable side effects.

Controls:

- Blood count: on day 1 and subsequently weekly
- Echocardiography, ECG Nab-paclitaxel: monitoring for cardiac events, cases of left ventricular dysfunction and congestive heart failure occurred.
- Day 1: TSH, fT3, fT4 Monitor for changes in thyroid function and signs of thyroid disease. Monitor for immune-mediated endocrinopathies at baseline and during therapy.
- Day 1: GOT, GPT, GGT, Bilirubin, AP, Cholinesterase Nab-paclitaxel: Liver monitoring before and during therapy, dose adjustment if necessary. Impairment of liver function possible with carboplatin therapy.
- Day 1: Glomerular Filtration Rate (GFR) monitor immune-mediated nephritis, Carboplatin dose calculation according to AUC and Calvert's formula; in normal renal function, expect a maximum GFR of 125 ml/min to avoid overdoses.
